SUMMARY

Level speed measurements have been made on Kittyhawk I, A.L. 229, fitted with flame damping exhausts for comparison with the results obtained on the same aeroplane fitted with individual stub exhausts (reported in 10th part of Report No. A. & A.E.E./783). With flame damping exhausts the top speed is reduced by 1 to 2 m.p.h., true air speed.

1. Introduction:

Kittyhawk A.L. 229 has been fitted with flame damping exhausts. Level speed measurements were required for comparison with speeds obtained with the individual stub pipe exhausts fitted.

2. Scope of tests.

Maximum level speeds were measured between 11,000 ft. and 19,000 ft. The tests were made between 9th June 1942 and 30th July 1942.

3. Condition of aeroplane relevant to tests made.

A full description of the aeroplane has been given in 10th Part of Report No. A & A.E.E./783; apart from the change of exhausts and the removal of the under fuselage fuel tank, the aeroplane was in the same condition for these tests. A photograph of the flame damping exhausts has been given in 4th Part of Report No. A & A.E.E./783 whilst the individual stub exhausts are shown in 6th Part of Report No. A & A.E.E./783.

Tests were made at the same weight as before i.e. 8485 lb.

4. Results of tests:

The speed measurements obtained with flame damping exhausts fitted are given in Table I and figure 1. The corresponding results with the individual stub pipe exhausts (under fuselage fuel tank removed) have been given already in 10th part of Report No. A & A.E.E./783. The results extracted from that report are shown dotted in figure 1. It will be seen that fitting flame damping exhausts has caused a small reduction of top speed of between 1 and 2 m.p.h., true air speed.

TABLE II
ENGINE LIMITATIONS

Maximum permissible r.p.m. for level flight (5 minute limit) = 3000
Maximum permissible boost for level flight, when automatic boost is not fitted (5 minute limit) = 42 inches of Hg.
