Performance tests were made on a Kittyhawk A.L. 229, with an external fuel tank fitted. Comparative level speeds were also measured with the tank removed. The tests show:

- Maximum rate of climb = 1530 ft/min. at 12,000 ft.
- Time to 20,000 ft. = 15.0 minutes.
- Service ceiling = 27,600 feet.
- Maximum level speed with tank fitted = 322 m.p.h. at 14,200 ft.
- " " " " removed = 332 m.p.h. at 14,400 ft.

1. Introduction

Performance measurements were made on a Kittyhawk fitted with an external jettisonable fuel tank. Photographs were attached to the 7th Part of Report No. 78. This report covers the climb and level speed results obtained. Comparative speeds with the external tank removed were also measured and are given in this report; the climb performance in this condition was not measured. Climb results on a Kittyhawk (A.K. 572) without the tank on, have been given in 8th Part of Report No. A.E.E./783.

The tests were made between 23/4/42 and 30/4/42.

2. Condition of aeroplane relative to tests made

Six 0.50 inch calibre wing machine-guns were fitted. For these tests the gun ports were sealed, but the ejection chutes unsealed. A rear view mirror was fitted above the windscreen.

R/T aerials ran from each wing tip to the tail fin. A V.H.F. aerial was fitted on the fuselage behind the pilot's cockpit. I.F.F. aerials were fitted.

The exhausts were individual stub pipes (not flame dampers). A streamline housing for the 0.45 camera gun was fitted underneath the

/starboard
starboard wing, just outboard of the undercarriage fairing. The jettison fuel tank of 43 Imperial gallons capacity was fitted on a bomb rack under the fuselage. With the tank on, the weight of the aeroplane was 8840 lb. and with it removed, 8485 lb. The propeller was a Curtiss electric type C.5313.S. - D.16 of 11 ft. diameter.

3. Results of Tests:

The results of climb tests are given in Table I and in Figure I and of level speed tests in Tables II and III and in Figure 2. The curve of position error correction for Kittyhawk A.K. 572 has been given in 8th Part of Report No. 783 and this was used in calculating these speeds, since the pressure head was in the same position and at the same setting on the two aeroplanes.

Partial climb tests were not made. An initial climbing speed of 145 m.p.h. A.S.L. was adopted since this is the speed recommended by R.A.F. pilots in the U.S.A. (Ref. Report C.T.E. - C.12), and was used for the climb test on A.K. 572.

The following results are extracted from the tables:

(i) Climb.
Maximum rate of climb 1530 ft/min. at 12,000 ft.  
Time to 10,000 ft. 6.6 mins.  
Time to 20,000 ft. 15.0 mins.  
Service ceiling. 27,600 ft.  
Estimated absolute ceiling 28,700 ft.

(ii) Level speed.
Maximum level speed with external tank fitted, 322 m.p.h. at 14,200 ft.  
" " " " " " " " " " removed, 332 m.p.h. at 14,400 ft.

4. Discussion of results:

A comparison with the climb results obtained on A.K. 572 without the external tank fitted, shows a reduction of rate of climb of 110 ft/min. This is accounted for by the increase of weight (360 lb. due to the external tank and fuel.

In level flight the maximum speed is reduced by 10 m.p.h. T.A.S. with the external tank fitted. Of this, only about 1/2 of 1 m.p.h. is accounted for by the increase of weight, the remainder being due to the drag of the external tank. The corresponding full throttle height is lowered by 200 feet; this can be accounted for by reduction in ram in the air intake, brought about by the reduced forward speed of the aeroplane.
